

SLIDE 1

The ask

We approve 17.6% of signups. Fixing how captains photograph their documents is worth a quarter to a half again as many approved captains, with no extra acquisition spend.

Signups, 1 Jan – 15 Jun 2026	22,561 (~4,140 a month)
Approved — Acquisition to Onboarded	17.6% (728 a month)
Approved captains who go on to drive	98.7% , median 1.4 days
Recoverable with no new spend	+183 to +344 approvals a month

Three decisions I need today

- **Fund** one product squad for six weeks on in-app document capture → **+81 to +134 approvals a month**
- **Decline** the 5x budget for CAMP_WA_002 → the win is mostly who was on the list, and 5x is arithmetically impossible
- **Decline** airport-catchment acquisition → fund a night-window incentive instead

Registered-to-Active looks after itself. Onboarding is the whole game.

SLIDE 2

Nine in ten captains we lose were never rejected. They stopped.

Where the loss sits	Lost	Share	How the 18,180 dropouts left	Captains	Share
Registration Certificate	5,433	29.9%	Passed one document, never started the next	9,727	53.5%
Insurance	3,309	18.2%	Rejected once, never tried again	6,791	37.4%
Fitness Certificate	2,669	14.7%	Never uploaded anything	1,425	7.8%
Permit (<i>Auto/Cab</i>)	2,630	14.5%	Ran out of their 3 attempts	237	1.3%
Driving Licence	2,594	14.3%			
Aadhaar	1,546	8.5%			

Only 1.3% of the captains we lose are a policy decision. The other 98.7% is friction we control.

The Registration Certificate is the worst step in the business — 17% of submissions fail there. Insurance is second, and hurts more, because those captains had already cleared everything else.

Cheap phones fail on paper documents, not on cards

The three affected documents are full-page paper covered in small print. The three unaffected ones are pocket-sized laminated cards. **46% of our signups are on basic handsets.**

- **Captains who try again mostly get through** — 79% eventually pass the Registration Certificate
- **Our rejection message does no work:** captains retry about 62% of the time whichever of the seven reasons they were given. "Blurred photo" and "document expired" produce identical behaviour.
- **Tested and rejected:** verification speed is not the problem. Checked within 2 hours, captains continue at 84.0%; after more than a day, 84.1%. Do not fund a queue-speed project.

CAMP_WA_002 is not an 18-point win. It is a list of survivors.

The message only goes out once a captain has already cleared two documents. None of the 7,981 recipients got it earlier — and getting through the Licence and Registration Certificate is where 44% of all our loss happens.

Two checks a real message effect has to pass	Approved	
Message delivered	31.5%	← no difference
Message failed to send	31.8%	
Tapped the message	30.8%	← no dose-response
Ignored it	32.0%	

On 5x: it already reaches 55% of everyone eligible, so full coverage is less than double. Extend it to the remaining ~1,200 eligible captains a month — WhatsApp costs almost nothing — but **hold 20% back as a comparison group**. Six months of running it, and we still cannot say what it does.

The airport isn't short of captains. It's short of captains at night.

- Terminals fill **59.8%** of requests against **96–97%** everywhere else in the city — but **86% of that shortfall is 8pm–4am**
- **48,720 captain-hours going spare** in hours already covered, against a **17,979-hour shortfall** at night — three times more waste than shortage
- One extra captain online at night converts to **1.31 extra rides**; at midday, **0.19**

And more captains would worsen why they stay away. Four in ten airport trips end in a suburb 23 km out:

Airport trip ends in	Share	Another fare within 20 min	Captain declines	Pay per hour it ties them up
City centre	42%	53%	8.6%	₹263
Suburb (23 km out)	41%	17%	21.0%	₹176

About a quarter of the airport demand we record as unmet is a captain who accepted, then cancelled. **Acquisition buys headcount; it cannot buy hours** — and the airport data carries no captain identity, so the home-zone premise cannot be tested at all.

What starts Monday, and how we'll know it worked

#	Action	Worth	Cost & lead time	How we'll know
1	In-app capture for the three paper documents: auto-capture, on-device blur check, worked example	+81–134 approvals/mo	1 squad, 6 weeks	Unreadable-photo rejections per submission, by handset
2	Chase stalled captains; start with the 2,500 who cleared all but Insurance; pair with financed insurance	+90–181 approvals/mo	CRM + 1 partner	Approval rate against a 20% holdout
3	Move half the paid digital budget to referral — judged on orders per 100 signups, not approvals	+18 approvals/mo, more orders	Reallocation	Orders per 100 signups by channel
4	Pay existing captains to work the terminals 8pm–4am	232–387 rides/day	₹2.9–7.2 lakh/mo = ₹41–62 per ride vs ₹279 fare	Terminal fill rate 8pm–4am, one terminal only at first
5	Guarantee a suburban-drop captain a ride waiting back at the terminal	₹176 → ₹216 per hour occupied	No cash cost , 4–8 weeks	Suburban decline rate

Not doing: activation work (98.7% already drive) · verification speed (tested, no effect) · city programmes (2.9 points apart, vs 8.8 across handsets) · a blanket suburban bonus (nine to twelve times the fare per extra ride) · airport-catchment acquisition

Total onboarding prize: +183 to +344 approvals a month on a base of 728 — and every point converts almost one-for-one into a driving captain.
